

100360 Low Power Dual Parity Checker/Generator

General Description

The 100360 is a dual parity checker/generator. Each half has nine inputs; the output is HIGH when an even number of inputs are HIGH. One of the nine inputs (I_a or I_b) has the shorter through-put delay and is therefore preferred as the expansion input for generating parity for 16 or more bits. The 100360 also has a Compare (\bar{C}) output which allows the circuit to compare two 8-bit words. The \bar{C} output is LOW when the two words match, bit for bit. All inputs have 50 k Ω pull-down resistors.

Features

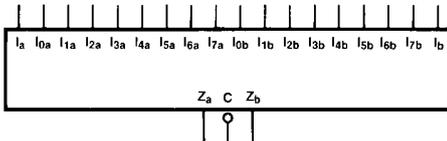

- Lower power than 100160
- 2000V ESD protection

- Voltage compensated operating range = -4.2V to -5.7V
- Min to Max propagation delay 35% tighter than 100160
- Available to industrial grade temperature range

Note 1: The "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the Electrical Characteristics tables are not guaranteed at the absolute maximum rating. The "Recommended Operating Conditions" table will define the conditions for actual device operation.

Note 2: ESD testing conforms to MIL-STD-883, Method 3015.

Note 3: The specified limits represent the "worst case" value for the parameter. Since these values normally occur at the temperature extremes, additional noise immunity and guardbanding can be achieved by decreasing the allowable system operating ranges. Conditions for testing shown in the tables are chosen to guarantee operation under "worst case" conditions.
