

## 100398 Quad Differential ECL/TTL Translating Transceiver with Latch

### General Description

The 100398 is a quad latched transceiver designed to convert TTL logic levels to differential F100K ECL logic levels and vice versa. This device was designed with the capability of driving a differential 25Ω ECL load with cutoff capability, and will sink a 64 mA TTL load. The 100398 is ideal for mixed technology applications utilizing either an ECL or TTL backplane.

The direction of translation is set by the direction control pin (DIR). The DIR pin on the 100398 accepts TTL logic levels. A TTL LOW on DIR sets up the ECL pins as inputs and TTL pins as outputs. A TTL HIGH on DIR sets up the TTL pins as inputs and ECL pins as outputs.

A LOW on the output enable input pin (OE) holds the ECL output in a cut-off state and the TTL outputs at a high impedance level. A HIGH on the latch enable input (LE) latches the data at both inputs even though only one output is enabled at the time. A LOW on LE makes the latch transparent.

The cut-off state is designed to be more negative than a normal ECL LOW level. This allows the output emitter-followers to turn off when the termination supply is -2.0V, presenting a high impedance to the data bus. This high impedance reduces termination power and prevents loss of low state noise margin when several loads share the bus.

The 100398 is designed with FAST™ TTL output buffers, featuring optimal DC drive and capable of quickly charging and discharging highly capacitive loads. All Inputs have 50 kΩ pull-down resistors.

### Features

- Differential ECL input/output structure
- 64 mA FAST TTL outputs
- 25Ω differential ECL outputs with cut-off
- Bi-directional translation
- 2000V ESD protection
- Latched outputs
- 3-STATE outputs
- Voltage compensated operating range = -4.2V to -5.7V

ECL Output Current (DC Output HIGH)	-50 mA		
TTL Input Voltage (Note 6)	-0.5V to +7.0V		
TTL Input Current (Note 6)	-30 mA to +5.0 mA		
Voltage Applied to Output in HIGH State 3-STATE Output	-0.5V to +5.5V		
Current Applied to TTL Output in LOW State (Max)	twice the Rated $I_{OL}$ (mA)		
ESD (Note 7)	$\geq 2000V$		

**Note 5:** The "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the Electrical Characteristics tables are not guaranteed at the absolute maximum rating. The "Recommended Operating Conditions" table will define the conditions for actual device operation.

**Note 6:** The specified limits represent the "worst case" value for the parameter. Since these values normally occur at the temperature extremes, additional noise immunity and guardbanding can be achieved by decreasing the allowable system operating ranges. Conditions for testing shown in the tables are chosen to guarantee operation under "worst case" conditions.

**Note 7:** ESD testing conforms to MIL-STD-883, Method 3015.
